## **Covid19 Relief**

---

The Coronavirus is a huge wake up call as a nation regarding disaster preparedness as well as possible enemy attacks.

Currently, we have a shortage of supply and as always medical personnel.

Going forward, we should give incentive for students who desire to study in the medical profession.

There are plenty of empty factories in Detroit that can be updated with machinery and 3D printers. We need factories in America in the event of another outbreak and now would be an opportune time to replenish our economy.

Military personnel should oversee some factories for specialized equipment and training.

Federal policy is required to mandate social distancing in situations that would require such.

We also need federal laws around rationing food and supplies during disasters and pandemics so that we can avoid the types of shortages that we have seen during the coronavirus.

Lastly, we need a national communications system that will help disseminate clear and concise information and direction to people across every state. This system can be linked through ISP's and cell phone carriers.

## **Replenishing Social Security**

More citizens at work will help to increase social security and help restore the middle class. This effort is all about United the States and rebuilding America, the right way. We need an increase in middle class jobs due to automation.

One program that can be instituted in businesses, organizations and institutions in many places and across many industries is the use of Smart Social Technology & Machinery. SSTM is the use of smart technology and equipment to assist in our re-introduction to society, allowing for social distancing to be implemented at maximum capacity and efficiency.

Example: Taking Your Car for an Oil Change

- 1.) Make an appointment through an app or website
- 2.) Drive your car to the specified garage bay at the appointment time.
- 3.) Park your car and notify the mechanics through the app that the car has been parked and keys left in lock box
- 4.) Mechanics work on car and call or notify through app info about progress and concerns
- 5.) Call or converse through app with representative regarding pick up time
- 6.) Pick up car with no human contact using secret code sent through app

It is important that this level of technology is not eliminating or replacing any jobs, and it actually adds more jobs to the workforce to support the apps and provide the proper amount of representatives needed to support social distancing efforts in terms of customer service and administration. These forms of technology will be instrumental in facilitating the re-opening of society as they will reduce the threat of the spread of the virus by ensuring greater levels of social distancing. These efforts of course still need to be coupled with ongoing practices surrounding cleanliness, sanitation and overall public health. The development of this technology should be supplemented by the government as an alternative to fully re-opening society.

The cost saved should allow companies to alleviate some outsourced positions and bring the back home.

With such advancements those innovations require factories and factories create jobs.

## **Long Term Veteran Care**

- Tuition forgiveness program by volunteering/working with veterans for medical related degrees.
- Building eco friendly homes where veterans can maintain a sense of community.
- Psychiatry students can spend their residency working one on one with veterans. These programs will allow students to earn student loan forgiveness.

## **Programs to End Homeless**

- Repurpose hotels to provide housing and the following services:
- Provide Classes, Trade Certificates, GED
- Delegate jobs to each resident that is doubles as grounds upkeep and work experience.
- Some locations can provide drug rehabilitations

## **Rebuilding Low Income communities**

- Residents can apply for nonprofit positions in their community where they can learn a trade going towards skills to restore.
- This will act as a source of responsibility and ownership of one's neighborhood.

## **College Affordability**

- Student Work Forgiveness should be required to all students as means to replenish the economy and gained experience. These programs should be offered to all students to significantly decrease the amount of loans required and debt of graduates.

- There should be an incentive for students who choose to study fields where there is dire need. Ex: Nursing, Education

## **Controlling Drug Prices**

- Drugs costs needs to mandated by tiers. Those that can afford the higher end drugs may do so but there needs to be a cap on all generic drugs.
- **NOTE**: With medical advancements, soon all patients should have medications tailored to their specific needs by use of compounding. The will cut down on the need for pharmaceutical companies all together.

International Database For Disease Prevention

IDDP is a database that is overseen by the CDC and WHO. This database allows for countries to report new onset cases of diseases and possible outbreaks. Much like (NORS), the IDDP organizes patient data by symptoms, age, pre-existing conditions, race, gender and labs submitted by overseeing physicians.

Using A.I., these symptoms can be categorized: Computing accurate graphs and percentages among patients by age, race, gender, conditions and labs but most importantly which medications or chemical compounds best to treat conditions, catering to each patient if need be.
