Psychocomputation Therapy

Psychocomputation Therapy is a computerized cognitive therapy to treat Internet psychosis, change patterns of thinking, and other cognitive disorders and/or syndromes. Utilizing a series of patterns and tests to diagnosis the characterization of the internet induced psychosis, the patient is treated with a series of patterns which induces the cognitive reversal through conditioning. It records the patients thought and learning patters. This method can both induced and treat psychosis and thought patterns. This therapy requires an immersive experience assisted with VR type glasses in order to engage the obsessive patterns which this diagnosis requires.

Cognitive restoration is also defining feature in this treatment, increasing recall of data and information. Emotion can be induced using this method associated with false memory in the event of warfare. The therapy is developed on a personalized plan for individual patients through the collaboration of Psychologists, Psychiatrists, Neurologists, and other Physicians.
