## Comcode Distributor

The comcode distributor is an innovative medical device which computes, compounds, and codes. Much like a pacemaker, this device is installed on the body as hardware (i.e. Vagus Nerve Stimulation implant). The device will be very compact in size, and its benefits include regulation and measurement of blood tests, and disease management for any number of medical conditions and chronic illnesses, including cancer, autoimmune disorders, and other diseases that require hands on medication management.

The Comcode monitors the body to collect and formulate patterned data which is sent to a third-party location where the prescribing physician can view and manage remotely. It monitors and produces patterns of the body's cycle and distributes custom compounded medical dosages as PRN, exactly how you need it and when it need it. Through this function, it can provide personalized management plans for patients based on height, weight, and other complex parameters.

Data will be collected and collated for tens of thousands of patients or more, organized by condition to provide useful information to feed algorithmic calculations that ensure the continuous improvement of the underlying software. Of course the data will be private, and protected by HIPPA laws, and it will be decoded to allow contributions to innovative textbooks and learning tools for students in the medical field. The information can also be utilized for case studies and study guides in classroom settings. The constant flow of data would be continually updated and refreshed, and the information would be kept in a shared database or digital environment for use across different platforms.

This method will revolutionize the medicinal and pharmaceutical industry, as it can decrease the amount of drug abuse and accidental overdosing. It allows physicians to have a 365 scope of the patient's makeup and diseases. With the data collected by the Comcode, physicians can monitor more closely how a disease progresses over time for a single patient or a collective. Most importantly, this can be used as a diagnostic

tool, for further education, and preventive medicine, by capturing images and data in way which customized and revolutionize medication.

In summary, the Comcode distributor is a new form of communication in the medical industry. It can be utilized as an effective diagnostics tool that uses a dynamic digital medical dictionary. The integration of Wi-Fi and Bluetooth technology will allow communication between consulting physicians and medical professionals to assist with complex treatment plans.
