Interceptive Communication Integration

(Morse Codex Systems)

Overview

Interceptive Communication Integration Morse Codex Systems is formulated to intercept social media telecommunications messaging through platform stories.

The account stories can then be intercepted and used as vehicles to rely two-way communication sequencing.

The process of using a similar format to the current methodology now in place, located in the account's privacy settings for delegation of authorization views. However, in the case of Interceptive Communication Integration (Morse Codex Systems) the output distributed is operated on an entirely different server. This requires a randomized sequencing output transmission which assist in avoiding detection.

The algorithm then organizes intelligences information in the proper order, per sequence deliverance upon transmitted intel, from sender to recipient.
