## Cryoimplantious

### Overview

Cryoimplantious is an innovative process which induces intracervical insemination over the course 24-36 hours of an ovulation cycle during the LH surge.

Cryoimplantious is small vial which automatically distributes semen during heighten LH surge for women who forgo the donor insemination processes.

This process increases chances of pregnancy exponentially with automatic distribution of potent semen upon detection LH levels from the vial which it is accompanied to by vaginal cup.

Procedure can be executed at home.
