Federal Generation Dynamics Operations Communications System**

**Procedure, Processes and Protocol**

**Overview**

In the event of an outage or threat in the FAA or systems processing and monitoring tools operating in similar processes, the Federal Generation Dynamics Operations Communications System can be engaged.

This moderation system is overseen by Navy intelligences in conjunction with Homeland Security and The Department of Defense, stationed on both foreign and surrounding territories unaffected by outages or threats.

This system operates on the backup generators which houses by proxy servers that pilots, radar, satellite, inferred technology that manages the monitoring and detection systems, as well past behavioral data to ensure safe grounding of aircrafts in mid-flight and the seamless continuation of patrolling on both foreign and US territories.

This generator is connected by proxy with secure access to up to date shared, past, and current data on a separate server for security, terrorism measures, and none weather related outages yet to be classified by officers.

The officers located outside of the affected zones can access the system and track intelligence data from the generators, radars, satellite, inferred technology of authorized and non-authorized aviation jurisdictions traffic as seen fit.

These systems are effective in the case of weather-related outages. These systems can be used on an ongoing basis to gather intelligences, particularly with the [AnonemiX Media Frequency](#) and eventually with the implementation of systems such as [Solar Satellite Telecommunications Network](#) and the [Solar Transportation Network](#), as primary or secondary protocol measures which will be highly instrumental in these processes and procedures.

The use of the [Department of Homeland Security Sociologic Behavioral Profile Tracking and Alert System](#) of inputting prior data from news circuits, high engagement content, sociological factors such as protests, revolts, and subsequent casualties for offensive tactical operations. As well as, tracking foreign trade deal activities relating to the United States Territories. As seen in [Behavioral Science of Online Harassment: Cyber-Micro-Expressions, Bullying and Stalking on Social Media](#).

This data acts as a monitoring system to determine the likelihood of an attack upon American soil in attempts in preventing sociologically behavioral patterns leading up to such catastrophic events.

Monitoring high-risk social media accounts who engage in radical issues relating to terroristic offenses as it relates to the United States Territory.

Utilizing the [Camascribe](#) system accumulate data report to immediate notify Homeland Security and Department of Defense.
